Dear Hiring Manager,

I am writing to express my strong interest in software engineering opportunities where I can contribute to building reliable, scalable, and high-impact systems. With over ten years of experience designing and delivering enterprise web applications in Java across finance, retail, government, and real-time payment environments, I have developed a solid foundation in building software that combines technical quality, business value, and operational reliability.

In my current role, I design and engineer high-throughput, scalable back-end services in Java for a global real-time payment platform. This work has strengthened my ability to build RESTful APIs with robust error handling, monitoring, and security, while contributing to architecture decisions and delivering in fast-paced, product-focused environments. Earlier in my career, I led the design of mission-critical web applications for the Brazilian Federal Police and helped establish automated testing and code review practices that improved engineering standards across teams.

My technical background spans the full Java ecosystem, including Spring and Spring Boot, Java EE, Hibernate and JPA, and PL/SQL, alongside disciplined engineering practices such as TDD, BDD with Cucumber, and automated delivery pipelines with Maven, Gradle, and Jenkins. I value clean code, peer review, continuous integration, and the ability to build maintainable systems that scale with business needs. I am especially interested in opportunities to work with high-performing teams that care about quality, collaboration, and continuous improvement.

I have also pursued applied AI and deep learning through a Udacity Nanodegree, which reflects my commitment to continuous learning and curiosity about emerging technologies. I enjoy collaborating with cross-functional teams, mentoring developers, and helping strengthen software engineering culture in ways that improve both delivery speed and product quality.

I would welcome the opportunity to discuss how my experience building secure, scalable, and resilient Java services can support your team’s goals. Thank you for your time and consideration.

Sincerely,

Madson Viana
